Piping Repairs?... No Problem! It's as simple as 1-2-3 with ENECON METALCLAD Systems

1

The area to be repaired is first thoroughly roughened using a grinder and rotary file. Then, using stainless steel mesh to bridge the actual holes, mixed METALCLAD SpeedAlloy is applied over these areas.

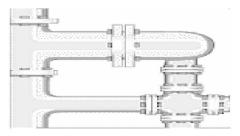

2

METALCLAD DurAlloy is then applied over the entire area, followed by Reinforcement Tape to "spiral wrap" the entire repair and more DurAlloy to completely cover the repaired area.

This severely pitted and corroded pipe elbow in the salt water fire fighting system on a ship proves no match for the capabilities of ENECON METALCLAD

3

The application is finished off with METALCLAD CeramAlloy CL+ to encapsulate the DurAlloy and to protect any "bare metal" areas exposed during the surface preparation process.
