

New York City Department of Environmental Protection Specifies CHEMCLAD GP & ENECRETE to Repair & Protect Critical Decking

ENECON North East has been working with the New York City D.E.P. for some time. When the D.E.P. expressed their desire to provide the best possible repair and protection procedure for these critical decks at one of their major sewage treatment plants in New York City, ENECON North East convinced the facilities' engineers to specify **CHEMCLAD & ENECRETE** to provide superior long-term protection to these decks.

When the bidding process was complete, a local contractor was selected to install the CHEMCLAD

system. Under the watchful eyes of ENECON North East's Field Engineering Team, all cracks in the concrete decks were first repaired with ENECRETE DuraQuartz and then the entire area was protected with CHEMCLAD GP.

About \$30,000 worth of DuraQuartz & GP were utilized to completely recondition the decks which are above the plant's main de-watering pumps.
