

Wastewater Treatment Facility Installs CHEMCLAD in New Headworks to Prevent Chemical Attack

Client: Wastewater Treatment Facility

Location: Northwestern U.S.

Problem: Preventative measures to provide chemical protection on new headworks construction.

Solution: In order to properly apply the material, the concrete needed to be dry. The area was contained and dehumidification equipment was used to dry the concrete. Damaged areas were repaired with ENECRETE WS. CHEMCLAD P4C was applied to prime the surface. Two coats of CHEMCLAD SC were then airless-spray-applied to provide unrivaled chemical protection.

Cost: \$140,000 turnkey project.
