

International Food Processing Plant in the Philippines Selects ENECLAD to Protect New Production Floors

This newly built, Japanese owned, food processing plant located in Davao City, in the Philippines, needed a “world class” floor protection system for their food processing areas. They will be processing marine, vegetable and fruit products at this plant.

They needed a highly durable floor protection system that would be easy to clean and maintain. After field-testing various internationally known

floor protection products, they selected *ENECLAD FPS* because of its outstanding adhesion and wear resistance and because it stood up to their strong cleaning and disinfecting compounds.

They also were well aware that they “*had to do it right the first time*” since the plant will be operating 24 hours a day and it will always be cold and wet in these areas. Re-coating, therefore, would be very difficult *and expensive* after the plant

began operating. They wanted the “*best product available*” for this demanding application.

The local ENECON Field Engineering Team installed the ENECLAD FPS system on 30,000 sq. ft. of their production and cold storage areas.

The plant engineers are very happy with the results as these photos illustrate.
