

Waste Water Treatment Plant Long Island, New York Confirms 'Outstanding Results' With ENEFLOW® after 2 Years!

ENEFLOW 5000's installed on boiler feed line.

ENEFLOW 1000's installed on boiler make-up water lines.

"The scale and slime in our boilers have been effectively controlled by using the ENEFLOW Power Cells," according to the Senior Maintenance Engineer at the sewage plant.

This is certainly not a 'snap judgement' on the part of the Maintenance Engineer since the ENEFLOW units were installed for almost two years!

The plant had purchased \$7,500 worth of ENEFLOW Power Cells from ENECON, in order to minimize the amount of cleaning required during regular boiler shut-downs. Although Long Island water is relatively soft, the Engineer confirmed that some mineral scale build-up did occur in the boilers and they wanted to see whether ENEFLOW could eliminate the problem.

The plant engineers are so impressed with the performance of the ENEFLOW systems that they specified that 6 new boilers, which were being installed in a new plant next door, would all be protected with ENEFLOW Fluid Dynamic Power Cells from inception!
